

Bali Cherry

Prunus 'Bali'

Height: 12 feet

Spread: 10 feet

Sunlight: ○

Hardiness Zone: 4

Other Names: Evans, Evans Bali, Evans Foothills

Description:

A compact fruit tree, the ideal size for backyard orchards; showy white flowers in spring followed by loads of bright red sour cherries in mid summer, excellent for pies and jam; needs full sun and well-drained soil, self-pollinating; extremely hardy

Edible Qualities

Bali Cherry is a small tree that is typically grown for its edible qualities. It produces cherry red round fruit (technically 'drupes') which are usually ready for picking in mid summer. Note that the fruits have hard inedible pits inside which must be removed before eating or processing. The fruits have a sour taste and a firm texture.

The fruit are most often used in the following ways:

- Baking
- Preserves

Features & Attributes

Bali Cherry is bathed in stunning clusters of fragrant white flowers along the branches in mid spring before the leaves. It has dark green deciduous foliage. The pointy leaves turn an outstanding orange in the fall. The fruits are showy cherry red drupes carried in abundance in mid summer. The fruit can be messy if allowed to drop on the lawn or walkways, and may require occasional clean-up. The smooth dark red bark adds an interesting dimension to the landscape.

This is a deciduous tree with a shapely oval form. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition. This plant will require occasional maintenance and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. It is a good choice for attracting birds and bees to your yard. It has no significant negative characteristics.

Aside from its primary use as an edible, Bali Cherry is suitable for the following landscape applications;

- Accent
- Orchard/Edible Landscaping

Planting & Growing

Bali Cherry will grow to be about 12 feet tall at maturity, with a spread of 10 feet. It has a low canopy with a typical clearance of 2 feet from the ground, and is suitable for planting under power lines. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 30 years. This is a self-pollinating variety, so it doesn't require a second plant nearby to set fruit.

This tree is typically grown in a designated area of the yard because of its mature size and spread. It should only be grown in full sunlight. It does best in average to evenly moist conditions, but will not tolerate standing water. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This particular variety is an interspecific hybrid.
